Oxford Academy Certificate

STUDENT PROJECTS

Q&A Platfrom (Full stack app)
January 2023 - February 2023

Description:
Developed a social network based on asking and answering questions, similar to the Quora application. The application was built using server-side rendering, utilizing Laravel and Blade. Users are able to create profiles, edit them, post questions, like and respond to comments, as well as follow each other. Additionally, the admin has access to all questions, approves them, manages new categories, bans users, and approves posts..

Tech stack: Laravel, JavaScript ,AJAX, JQuery, MySQL

Code : https://github.com/Mateja989/laravel-project

Sneakers shop (E-commerc full stack app)
July 2022 - August 2022

Description:
Developed an e-commerce website for selling footwear. Admin manages purchases, product listings, and has access to detailed website statistics, including page-specific traffic percentage. Users can browse, search, and purchase products, with the option to create accounts.

Tech stack: PHP, JavaScript, AJAX, JQuery, MySQL, HTML, CSS

Code : https://github.com/Mateja989/php1

HomeID (Rent and sell real estate full stack app)
March 2022 - May 2022

Description:
My first full-stack project, starting from UI/UX design to database design, front-end, and back-end development. An online platform for buying and renting all types of properties in Serbia, with two user roles: regular users and real estate agents for sales and rentals. Regular users can apply to become agents by submitting a valid work permit for verification by the system administrator, who reviews it within 24 hours. Users can search and schedule property viewings, while agents can create, manage, delete, and edit property listings and view scheduled appointments. The system administrator approves property listings and agent applications and has full access to all website activities.

Tech stack: PHP, JavaScript, AJAX, JQuery, MySQL, HTML, CSS

Code : https://github.com/Mateja989/php2

Watch shop (Frontend app)
March 2022 - April 2022

Description:
WatchShop is a simulation of an e-commerce store where users can browse products, apply filters, sort items, and add them to their cart. Product data is generated and simulated using JSON files.

Tech stack : JavaScript, JQuery, AJAX, JSON

Visit : https://mateja989.github.io/watchshop/

Code : https://github.com/Mateja989/watchshop

DevGym (Single page website)
November 2021 - December 2021

Description:
Single-page website, resembling a gym landing page. Figma was used for UI/UX design.

Tech stack: HTML, CSS, JavaScript, JQuery, Figma, Responsive design
